Abstract: The genus Cotysoides was erected in 2000, recognizable through the following morphological characters: size small; anterior margin of vertex protruding beyond eyes; antennae inserted in the lower one third level of anterior margin of eyes; disc of pronotum densely covered with small tubercles; median keel undulated, with a series projections; hind process not reaching the top of hind femur; lateral lobe of pronotum turning over outwards, posterior angles truncate; hind wing not reaching the top of hind process; the first segment of hind tarsus longer than the third. This paper reports six species of the genus Cotysoides Zheng et Jiang, including a new species, Cotysoides interruptus sp. nov. The new species is allied to Cotysoides guangxiensis Zheng et Jiang, 2000, but differs in: 1) width of vertex 1.5 times of an eye; 2) top of anterior angle of lateral lobe of pronotum obtuse angular; 3) hind wing reaching the knee of hind femur; 4) width of midfemur narrower than the width of tegmina; 5) hind margin of subgenital plate of female with a triangular projection in the middle. A key to species of Cotysoides is provided. Type specimens are kept in Institute of Zoology, Shaanxi Normal University and the Museum of Southwest Forestry University.

拟科蚱属 Cotysoides 为郑哲民和蒋国芳于 2000 年建立,属模式种为分布于广西的 C. guangxiensis Zheng et Jiang, 2000(郑哲民和蒋国芳, 2000);郑哲民和蒋国芳(2003)报道了 C. albipalpulus Zheng et Jiang, 2003;郑哲民等(2010)报道了 C. yunnanensis

Zheng et Mao, 2010, 至此拟科蚱属共计有3种,主要分布于我国广西壮族自治区和云南省。

2010 年我们在云南省怒江地区进行蚱类调查中,发现拟科蚱属1个新种,描述如下。本文还对该属进行了修订,并将西藏波蚱 Bolivaritettix
